A method for the prediction of slamming loads on ship hulls is presented and validated for a 20-knot, 120-m car carrier. A nonlinear strip theory is used to calculate the relative motions of ship and wave. The relative vertical and roll velocities for a slamming event are given as input to the slamming calculation program, which is based on a generalized two-dimensional Wagner formulation and ...

This paper describes how tangential impact velocities can be incorporated into well-known impact theories in deep and shallow water. Taking the deep and shallow flows in turn, it is shown how to link the normal impact Wagner and Korobkin theories to the tangential impact theories of planing and skimming, respectively. An instability is revealed that limits the configurations that can be ...

2. Background model. Experimental results covering collisions, rebounds and skimming in qualitative form are quite plentiful as described in [1,26], whereas justifiable mathematical models seem few.The present contribution is associated closely with the Hicks-Smith model [] of skimming in unsteady two-dimensional interactions.Such exciting interactions which offer an example of fluid-body ...
