(Stanford Achievement Test Series, Tenth Edition) - Pearson Assessments

Ans.1 The Pearson 's correlation coefficient is calculated as the covariance of the two variables divided by the product of the standard deviation of each data sample. It is the normalization of the covariance between the two variables to give an interpretable score. The formula is as stated below:
$$r = \frac{\sum(X - \bar{X})(Y - \bar{Y})}{\sqrt{\sum(X - \bar{X})^2}\sqrt{\sum(Y - \bar{Y})^2}}$$

Karl Pearson's Correlation Coefficient Properties, Solved Example
