Radar Basics - Phased Array Antenna

The Array Factor is a function of the positions of the antennas in the array and the weights used. By tailoring these parameters the antenna array's performance may be optimized to achieve desirable properties. For instance, the antenna array can be steered (change the direction of maximum radiation or reception) by changing the weights.

Phased Array Antennas With Optimized Element Patterns ...

A phased array antenna could meet all requirements from HTS communication with LEO satellites, however, no mature products suitable for low-cost commercial markets have been available until now. "ReQuTech has since 2009 developed antenna solutions for Satcom within Ka, Ku X and C band. For that last 2 years, we have conducted development ...

Phased Array Antennas

Applications of phased arrays Phased array antennas can be electrically steerable, which means the physical antenna can be stationary. This concept can eliminate all the headaches of a gimbal in a radar system. It can keep an antenna locked onto a satellite, when the antenna is mounted on a moving platform.

Antenna Arrays (Phased Arrays) An antenna array (often called a 'phased array') is a set of 2 or more antennas. The signals from the antennas are combined or processed in order to achieve improved performance over that of a single antenna. The antenna array can be used to:

MIMO And Phased-Array Antennas For 5G
A phased array antenna is an array antenna whose single radiators can be fed with different phase shifts. As a result, the common antenna pattern can be steered electronically. The electronic steering is much more flexible and requires less maintenance than the mechanical steering of the antenna.

The Array Factor - Antenna Theory

In antenna theory, a phased array usually means an electronically scanned array, a computer-controlled array of antennas which creates a beam of radio waves that can be electronically steered to point in different directions without moving the antennas.
