Quantum entanglement is a physical phenomenon that occurs when a pair or group of particles are generated, interact, or share spatial proximity in a way such that the quantum state of each particle of the pair or group cannot be described independently of the state of the others, including when the particles are separated by a large distance.

According to the principle of superposition, the net displacement of the medium when both waves are present is the sum of D_R and D_L : We can simplify this by using a trigonometric identity, and arrive at: Where the amplitude function $A(x)$ is defined as: The amplitude reaches a maximum value of $A_{\max} = 2a$ at points where $\sin kx = 1$.
