A hydrogen atom is an atom of the chemical element hydrogen. The electrically neutral atom contains a single positively charged proton and a single negatively charged electron bound to the nucleus by the Coulomb force. Atomic hydrogen constitutes about 75% of the baryonic mass of the universe.. In everyday life on Earth, isolated hydrogen atoms (called "atomic hydrogen") are extremely rare.

Remediation of environmental pollution usually involves use of chemical reagents, making the process costly whilst generating secondary pollution. Catalysis instead of stoichiometric chemicals is one of the 12 principles in green chemistry. The current work demonstrates a process to achieve radical-based advanced oxidation using only air and electricity, offering

Statement of the law. The force of viscosity on a small sphere moving through a viscous fluid is given by: = where: F_d is the frictional force - known as Stokes' drag - acting on the interface

between the fluid and the particle; μ is the dynamic viscosity (some authors use the symbol η); R is the radius of the spherical object; v is the flow velocity relative to the object.
