WHY and HOW to GROUND ELECTRICAL SYSTEMS Dr. Tom Van Doren Van Doren Company Rolla, MO, USA 1-573-578-4193 vandoren@mst.edu emc-education.com emclab.mst.edu Grounding is a very controversial and misunderstood concept. In the very early days of power distribution and telegraphy the earth (ground) was used as the current return path.

Véronique Beauvois, Ir. 2015-2016 - Montefiore Institute

The multitude of app notes and articles on this subject that recommend grounding the shield at one end only misrepresent the physics of shielding and falsely ascribe a ground loop to the shield where the circuit itself was part of the original ground loop. Cable shielding and ground loops must be disassociated.

Earthing/grounding and EMC: For a lot of EMC phenomena (transient disturbances, HF currents...), earthing conductors are not efficient as they are very long and the used topology means a high impedance versus HF. The only solution is meshing to get equipotentiality. Mesh size: $\pm \lambda/10$.

But the EMC functions are different; the word Grounding will be used to distinguish the EMC function while Earthing will be used for the safety function. The recognized and accepted purpose for grounding is to give a reference for external connections to the system.

Few topics generate as much controversy and argument as that of grounding and the associated topics of surge protection, shielding and lightning protection of electrical and electronic systems. Poor grounding practice can be the cause of continual and intermittent difficult-to-diagnose problems in a facility.

On the other hand, a low-resistance grounding is designed for ground fault currents of 100 A or more with values of even 1000 A being common. The value of ground fault current is still far lower than three-phase system fault currents.

Practical EM Shielding. Shielded enclosures generally surround a product's circuitry on all sides. Care is taken to ensure that all apertures are small and every seam is sealed. On the other hand, it is not uncommon to find shields that don't surround the entire product. Often a shield partially covers only a few circuits.
