The measured (counted) number of colonies n^j is related to the true number of colonies n_j by $n_j = n^j + \delta_j$ where δ_j is a bias that accounts for uncounted colonies due to the merging (overcrowding) of nearby colonies, and thus, $n_j \geq n^j$. The challenge is to obtain an estimate of δ_j from a single measurement n^j of the j th Petri dish. The challenge is met in an ad-hoc manner.

The time before the symptoms of a viral infection appear is called the incubation period.During this time, viral genomes are replicating and the host is responding, producing cytokines such as interferon that can have global effects, leading to the classical symptoms of an acute infection (e.g., fever, malaise, aches, pains, and nausea). These symptoms are called the prodrome, to distinguish ...

Stress granules are assemblies of untranslating messenger ribonucleoproteins (mRNPs) that form from mRNAs stalled in translation initiation. Stress granules form through interactions between mRNA-binding proteins that link together populations of mRNPs. Interactions promoting stress granule formation include conventional protein-protein interactions as well as interactions involving ...
