What is Process Mining and how does it relate to BPM?

Applicability of Process Mining

Techniques in Business Environments This thesis analyses problems related to the applicability, in business environments, of Process Mining tools and techniques. The first contribution is a presentation of the state of the art of Process Mining and a characterization of companies, in terms of their "process awareness".

Process Mining

Process mining is the missing link between model-based process analysis and data-oriented analysis techniques. Through concrete data sets and easy to use software the course provides data science knowledge that can be applied directly to analyze and improve processes in a variety of domains.

Each one of the thousands of business processes in a mining company's operations will be represented by a workflow within its software solution. These processes, defined by employees (the actual software users), are broken down into individual tasks within the software, grouped together in the order that they are performed, and assigned to the users who actually perform the tasks.

Process Mining in Industry Abstract:

Process mining is a set of analysis techniques that provides a data-based overview of how business processes are actually executed. In order to use process mining techniques the data about the business process execution has to be recorded into a chronological sequence of

Process Mining: Data science in Action.

Evidence-based business process management based on process mining helps to create a common ground for business process improvement and information systems development. The course uses many examples using real-life event logs to illustrate the concepts and algorithms.

Process mining - Wikipedia

Process Mining defined. Process Mining is a cross between Business Process Management and Data Mining. Process Mining will give you an overview of the processes being used in your organization, enabling you to keep the things that work and get rid of everything that doesn't.
