Seventh grade Lesson Incomplete Dominance and Co-dominance

If one of the parents is a homozygote for one or more traits, the Punnett Square still contains the same number of boxes, but the total number of unique allele combinations is 2 raised to the power of the number of traits for which the parent is heterozygous. A commonly discussed Punnett Square is the dihybrid cross.

Two inheritance patterns are discussed in this video: (1) Codominance, (2) Incomplete dominance. I use this PowerPoint in my biology class at Beverly Hills High School.

GENETICS PRACTICE 2: BEYOND THE BASICS INCOMPLETE DOMINANCE

When comparing codominance vs. incomplete dominance, it can be useful to see visuals of how they pass their genes onto their offspring. Below are three Punnett squares, two for incomplete dominance and one for codominance. Incomplete Dominance. In the Punnett square below we are crossing a pure red flower (RR) with a pure white flower (rr).

Punnett Square Calculator | Science Primer

And we can do these Punnett squares. They don't even have to be for situations where one trait is necessarily dominant on the other. For example, you could have the situation-- it's called incomplete dominance. Let's say you have two traits for color in a flower. You could have red flowers or you could have white flowers.

just 2 alleles. That means we are dealing with either incomplete or codominance. Since orange is a blend of red & yellow, it's incomplete dominance. So the "in-between" phenotype is the hybrid, orange in this example.

Punnett Squares 2 Incomplete Dominance

A Punnett square for a cross between two heterozygous snapdragons will predict the genotypes RR, Rr, and rr in a 1:2:1 ratio, and since these alleles display incomplete dominance, the phenotypes will be red, pink and white in a 1:2:1 ratio. The Punnett square demonstrates incomplete dominance by predicting the genotypes of the offspring.

incomplete dominance genetics Flashcards - Quizlet

This Punnett square illustrates incomplete dominance. In this example, the red petal trait associated with the R allele recombines with the white petal trait of the r allele. The plant incompletely expresses the dominant trait (R) causing plants with the Rr genotype to express flowers with less red pigment resulting in pink flowers.
