Nuclear winter is a severe and prolonged global climatic cooling effect that is hypothesized to occur after widespread firestorms following a large-scale nuclear war. The hypothesis is based on the fact that such fires can inject soot into the stratosphere, where it can block some direct sunlight from reaching the surface of the Earth. It is speculated that the resulting cooling would lead to ...

SE is +/- .05 meaning a range of .085 per decade to .185 per decade. Looking at the data it appears the SE is generated by natural variation. And since it appears that natural variation has been mostly in a positive trend since 1980 it seems likely the actual man made trend leans toward a significantly lower rate of warming, but thats been well known (IPCC et al) for a long time.

An aqueous suspension of silica nanoparticles or nanofluid can alter the wettability of surfaces, specifically by making them hydrophilic and oil-repellent under water. Wettability alteration by nanofluids have important technological applications, including for enhanced oil recovery and heat transfer processes.

Thermal storage—from heat charge and discharge both diurnally and seasonally, a function of its specific heat, weight, and conductivity. Although not usually listed alongside the four classic means of heat transport, this role of thermal storage is helpful in understanding the heat transfer physics of building climatology. Fig. 4.

Luminance en photométrie. La photométrie se propose d'associer des grandeurs mesurables à la perception de la lumière. Ce programme implique un étalon auquel comparer les grandeurs. Pour des raisons de commodité, et parce que le premier objectif des études photométriques était de comparer les moyens d'éclairage, cet étalon a été défini comme une source de lumière, une bougie ...
