Resistance prediction methods generally fall into the following categories: planing hull series, prismatic equations, numerical methods, empirical calculations and theoretical methods. All prediction methods mentioned above are based on the same data, experiments, and observations of planing hull models tests. Prismatic bodies have constant cross

Blount and Fox (1976) made resistance prediction of existing planing hulls: non-mono-hedral and non-constant beam to define the "effective beam and deadrise" to use in the prismatic plate planing equations. The conclusion was that the maximum chine beam and the deadrise at mid-chine length i.e.,

The high-speed stability problem of semi-displacement hulls may also occur with planing hulls. In one particular project, HSVA investigated alternatively a semi-displacement and a planing hull design for a 45-knot yacht. The planing hull had lower calm-water resistance for high speeds, but the semi-displacement hull performed better in waves.

Initial Hydrodynamic Hull Design for  
Conventional Fast Vessels

Planing hull drag prediction using the Savitsky method Planing is a hydrodynamic state where a hull is dynamically supported by pressures that are developed by the forward motion of the vessel. Before addressing the state of planing, let's consider what a boat needs to do before getting up on plane.
