Although design patterns have been the focus of widespread interest in the software industry for several years, particularly in the object-oriented and component-based software fields, it is only recently that there has been increasing interest in architecture patterns - extending the principles and concepts of design patterns to the architecture domain.

In software engineering, a resource-oriented architecture (ROA) is a style of software architecture and programming paradigm for supportive designing and developing software in the form of Internetworking of resources with "RESTful" interfaces. These resources are software components (discrete pieces of code and/or data structures) which can be reused for different purposes.

Resource-Oriented Architecture (ROA)

The phrases "resource-oriented" and "resource-oriented architecture" have been used to describe RESTful architectures in general. I

don't claim that "Resource-Oriented Architecture" is a completely original term, but I think that my usage meshes well with preexisting uses, and that it's better to use this term than claim to speak for REST as a whole.
