Before discussing further on rings, we define Divisor of Zero in A ring and the concept of unit. Divisor of Zero in A ring – In a ring R a non-zero element is said to be divisor of zero if there exists a non-zero element b in R such that a.b=0 or a non-zero element c in R such that c.a=0 In the first case a is said to be a left divisor of zero and in the later case a is said to be a right ...

Algebraic Structures - Fields, Rings, and Groups - Mathonline

In algebra, a group ring is a free module and at the same time a ring, constructed in a natural way from any given ring and any given group. As a free module, its ring of scalars is the given ring, and its basis is one-to-one with the given group. As a ring, its addition law is that of the free module and its multiplication extends "by linearity" the given group law on the basis.

Group ring - Wikipedia

In mathematics, a field is a set on which addition, subtraction, multiplication, and division are defined and behave as the corresponding operations on rational and real numbers do. A field is thus a fundamental algebraic structure which is widely used in algebra, number theory, and many other areas of mathematics.. The best known fields are the field of rational numbers, the field of real ...

Field (mathematics) - Wikipedia

Every field is a ring, and every ring is a group. A group has one operation which satisfies closure, associative property, commutative property, identity, and inverse property. A ring satisfies all properties of a group; it also has a second operation which has closure, associative, and distributive property between these two operations.

EXERCISES AND SOLUTIONS IN GROUPS RINGS AND FIELDS 5 that  $(y(a)a)y(a)t = e$  then  $(y(a)a)e = e$  Hence  $y(a)a = e$ : So every right inverse is also a left inverse. Now for any  $a \in G$  we have  $ea = (ay(a))a = a(y(a)a) = ae = a$  as  $e$  is a right identity. Hence  $e$  is a left identity. 2.4. If G is a group of even order, prove that it has an element  $a \neq e$  satisfying  $a^2 = e$ :

Introduction to Groups, Rings and Fields

Groups, Rings, and Fields. Everyone is familiar with the basic operations of arithmetic, addition, subtraction, multiplication, and division. In the "new math" introduced during the 1960s in the junior high grades of 7 through 9, students were exposed to some mathematical ideas which formerly were not part of the regular school curriculum.

EXERCISES AND SOLUTIONS IN GROUPS RINGS AND FIELDS

Groups, Rings, and Fields Groups, rings, and fields are the fundamental elements of a branch of mathematics known as abstract algebra, or modern algebra. In abstract algebra, we are concerned with sets on whose elements we can operate algebraically; that is, we can combine two elements of the set, perhaps in several ways, to obtain a third element of the set.
