Selecting the mechanical dimension of the CT CTs are available in a number of different physical sizes. The inner diameter of the CT must be large enough to fit around the conductive wire you wish to monitor. The outer dimensions must be small enough to be installed inside the circuit panel or switch gear.

selection of current transformers (CTs) that are too large and heavy for use inside low-voltage motor control centers. The authors were recently challenged with finding a simplified set of current transformer selection criteria for over 5,000 low-voltage drawers to be installed at a large oil and gas field located in Central Asia.

3. Wire gauge. Current density is the key factor for the current output capability of the transformer within a safe temperature i.e around 50 C. A 2.565A/mm² it is a good choice. Higher densities results in temperature increase but lower increase the weight of transformer and may be you need to use next size of core in order to wound your wire.

Selecting a Current Transformer. Determining the transformer ratio I_p/I_s • For the transformer primary current, select the standard value immediately higher than the current to be measured. ie : current to be measured 1124 A. Select $I_p = 1250$ A • For the secondary current, choose 1 A or 5 A depending on the instrument or relay,...

The WattNode current transformer inputs will saturate and become inaccurate if the peak current is too high. This means you may want to be conservative in selecting the CT rated current. For example, if your load draws 10 amps RMS, but has a crest factor of 3.0, then the peak current is 30 amps.

We always recommend current transformers with the same precision class for the UMG measuring devices. Current transformers with a lower precision class lead in the complete system - current transformer + measuring device - to a lower accuracy of measurement, which is defined in this case by the precision class of the current transformer.
