More and more as sound systems become more sophisticated, players want to be in the system. In fact, the sound board operator wants everything in the system so he or she can control it. If you have a really strong system with plenty of channels AND a good operator, this is certainly possible. However, the complexity becomes daunting.

In economics, factors of production, resources, or inputs are what is used in the production process to produce output—that is, finished goods and services. The utilized amounts of the various inputs determine the quantity of output according to the relationship called the production function. There are four basic resources or factors of production: land, labour, capital and entrepreneur (or ...

It should be clear that the second sum is larger. The first term alone is  $hn/2 = 1/2 n \log n$ , so this approach has complexity at best  $O(n \log n)$ . How do we prove the sum for the siftDown approach is indeed  $O(n)$ ? One method (there are other analyses that also work) is to turn the finite sum into an infinite series and then use Taylor series.

Write Clear And Concise Labels. The label is the text that tells users what data is expected from them in a particular input field. Writing clear labels is one of the best ways to make a form more accessible. Labels should help the user understand what information is required at a glance. Avoid using complete sentences to explain.

How can building a heap be  $O(n)$  time complexity?

Every answer currently responding to this question tells you that the  $O(1)$  means constant time (whatever it happens to measuring; could be runtime, number of operations, etc.). This is not accurate. To say that runtime is  $O(1)$  means that there is a constant  $c$  such that the runtime is bounded above by  $c$ , independent of the input. For example, returning the first element of an array of  $n$  integers ...
