Engineering geology and rock slope stability - Part 1 ...  
Slope stabilization is a team effort. Civil engineering grading plans and geotechnical soil testing are an essential part of a good solution. When necessary, we work with a team of professional civil and geotechnical engineers to provide stabilized sites. Once this information is gathered, we perform the slope stability analysis and design.

I'm not sure how they came up with the 10% and 25%, but I think the rational behind it comes down to stormwater infiltration and runoff velocities. The more development the less pervious area which increases runoff. As the slope and runoff volume increases the velocities rise which can carry sediments off site.

Slope stability is the process of calculating and assessing how much stress a particular slope can manage before failing. Examples of common slopes include roads for commercial use, dams, excavated slopes, and soft rock trails in reservoirs, forests, and parks. Considering the importance of slope stability to their work, it ' s beneficial for civil engineers to understand how to
