How soil functions on every inch of a farm, not just in buffers or waterways, affects erosion rates, agricultural productivity, air quality, and water quality. The most practical way to enhance soil health today is to promote better management of soil organic matter or carbon (C). In short, we should go beyond T and manage for C.

organic matter content of soils in-creases slowly as a result of con-tinuous addition of organic mate-rials to the soil. Warm and humid climates encourage the decompo-sition of these materials. But these same conditions also enhance de-composition of soil organic matter (called mineralisation). Excessive tillage speeds up this process as

**SEVEN WAYS TO SAVE OUR SOILS - Soil Association**  
Soil organic matter content is a function of organic matter inputs (residues and roots) and litter decomposition. It is related to moisture, temperature and aeration, physical and chemical properties of the soils as well as bioturbation (mixing by soil macrofauna), leaching by water and humus stabilization (organomineral complexes and aggregates).
