Hydroponics is a type of horticulture and a subset of hydroculture, which is a method of growing plants, usually crops, without soil, by using mineral nutrient solutions in an aqueous solvent. Terrestrial plants may be grown with only their roots exposed to the nutritious liquid, or, in addition, the roots may be physically supported by an inert medium such as perlite, gravel, or other substrates.

Irrigation Scheduling in Soilless Culture

Leading types of soilless solutions are medium culture and solution culture. These are further subdivided into categories, such as continuous flow solution, static solution and aeroponics for solution cultures, and gravel and sand culture for medium cultures.

Soilless Culture

Soilless culture methods offer unique benefits such as capabilities to control water availability, pH, and nutrient concentrations in the root zone. At the same time, there are higher risks because of the smaller root system and low buffering capacity for water and nutrients and because of the increased risk of exposure to extreme ambient temperatures.

Soilless farming - Hydroponic crop cultivation - Soilless

Soilless culture in bags, pots, or troughs with a lightweight medium is the simplest, most economical, and easiest to manage of all soilless systems. The most common media used in containerized systems of soilless culture are peat-lite (Boodley and Sheldrake, 1977), or a mix-ture of bark and wood chips.

**DEFINING SOILLESS CULTURE** Soilless culture is an artificial means of providing plants with support and a reservoir for nutrients and water. The simplest and oldest method for soilless culture is a vessel of water in which inorganic chemicals are dissolved to supply all of the nutrients that plants require. Often called solution culture or water ...

**Advantages of Soilless Agriculture** Faster growth: A more optimized feeding plan means more grow cycles per year, more yield, more food. Extreme decrease in water and nutrient use: By closing the loop and recycling the water through the system hydroponics typically uses at least 90% less water than soil-based methods.

Soilless Culture: Theory and Practice - 2nd Edition

In closed-loop soilless culture systems, variation in nutrients can lead to instability in the nutrient management and forced discharge of nutrients and water. Total nutrients absorbed by plants are replenished in an electrical conductivity-based closed loop system, and fluctuation in electrical conductivity within a certain range around the initial value can be expected.
