### Solid Rocket Propulsion Technology

This chapter presents an overview of the propulsion elements for solid rocket motors. A rocket motor is designed to ensure that combustion occurs under pressure of the propellant grain it contains. The resulting gases are expanded through a nozzle, whose function is to convert this pressure into supersonic exhaust.

Ion propulsion rockets can heat a plasma or charged gas inside a magnetic bottle and release it via a magnetic nozzle, so that no solid matter need come in contact with the plasma. Of course, the machinery to do this is complex, but research into nuclear fusion has developed methods, some of which have been proposed to be used in propulsion systems, and some have been tested in a lab.
