The variable  $x$  is the height and the variable  $y$  is the flow rate. The three lowest heights give the same time, so we discard the heights of 1 and 2 cm. The power function fitted by eye in terms of the height  $h$  is approximately  $f = 4h^{0.9}$ . Note that the exponent is not close to 0.5, as it is for orifice flow.

System Dynamics for Engineering Students: Concepts and Applications features a classical approach to system dynamics and is designed to be utilized as a one-semester system dynamics text for upper-level undergraduate students with emphasis on mechanical, aerospace, or electrical engineering. It is the first system dynamics textbook to include examples from compliant (flexible) mechanisms and micro/nano electromechanical systems (MEMS/NEMS).

### System Dynamics for Engineering Students

This was the only text for the course and I honestly couldn't find another text of system dynamics that I could get a hold of quickly enough to master the material. In my opinion this book is a great resources if MatLab is available wherever you may be whether it's in higher education or in the field.
