In mathematics, a rotation of axes in two dimensions is a mapping from an  $xy$ -Cartesian coordinate system to an  $x'y'$ -Cartesian coordinate system in which the origin is kept fixed and the  $x'$  and  $y'$  axes are obtained by rotating the  $x$  and  $y$  axes counterclockwise through an angle  $\theta$ . A point  $P$  has coordinates  $(x, y)$  with respect to the original system and coordinates  $(x', y')$  with respect to the new ...

That notation specifies you are looking at the rate of change for the function  $f(x,y,z)$  at a specific point  $(x_0, y_0, z_0)$ .The symbol  $\nabla$  is called "nabla" or "del". This idea is actually a generalization of the idea of a partial derivative.For a partial derivative, you take the rate of change along one of the coordinate curves while holding all other coordinates constant.

Derivatives / Differential Calculus: Definitions, Rules ...  
Differentiation is the action of computing a derivative. The derivative of a function  $y = f(x)$  of a variable  $x$  is a measure of the rate at which the value  $y$  of the function changes with respect to the change of the variable  $x$ .It is called the derivative of  $f$  with respect to  $x$ .If  $x$  and  $y$  are real numbers, and if the graph of  $f$  is plotted against  $x$ , derivative is the slope of this graph at each ...
