Once you have a solution and have checked it, you can always ask the forum members to check your solution too, and if there are problems with it then they can point them out to you. In my opinion, this is much better than just using a solutions manual, since this way you have the opportunity to correct your argument on your own.

Abstract In this paper, the authors present a Global Positioning System (GPS) algorithm for medium accuracy (1-m rms) positioning of ocean buoys. The application addressed in this paper is that of the Fast Pegasus experiments that require the positioning of surface buoys used in collecting subsurface acoustic data for ocean current profiling.

Spivak really loves differential geometry, as these books show (I will restrict myself to the first two volumes, for I am unfamiliar with the rest). Everything is motivated with the utmost care--all the abstract topological stuff in the first volume is made completely natural in setting up the geometric content of the second volume.
