then Eq. () has no bounded stable positive solution. We remark that for Eq. () (with $(\alpha = 0)$), the critical exponent on the right-hand side of was first found in []. This exponent has been shown to be optimal in the class of positive stable weak solutions; see []. Similar to the celebrated Lane–Emden system in the case of positive exponents, the system is also a natural extension of Eq.

Stable solutions are ubiquitous in differential equations. They represent meaningful solutions from a physical point of view and appear in many applications, including mathematical physics (combustion, phase transition theory) and geometry (minimal surfaces). The regularity of stable solutions to semilinear elliptic equations is a very classical topic in elliptic equations, initiated in the seminal paper of Crandall and Rabinowitz, which has given rise to a huge literature on the topic; see the monograph for an extensive list of results and references.

Qualitative behavior. Elliptic equations have no real characteristic curves, curves along which it is not possible to eliminate at least one second derivative of from the conditions of the Cauchy problem. The nonexistence and stability of solutions to nonlinear elliptic partial differential equations have drawn much attention in the last decades. Readers can find recent developments on stable solutions in the monograph [6] by Dupaigne, and on related problems in [1, 3, 7, 13]. We should mention here the results in [8, 9] for Lane-Emden-Fowler equation

This paper is devoted to the study of rigidity properties for special solutions of nonlinear elliptic partial differential equations on smooth, boundaryless Riemannian manifolds.
