Let us not ask whether the brain is "really" a biological computer. The more productive question is whether it is useful to think of the brain as a computer, one designed by evolution to solve problems of adaptation via specialized "circuits" and "architecture." Does this biocomputational approach,

This evolutionary development, it is suggested, manifests a transition from biological and socio-cultural forms of evolution to incorporating a new level: that of neuro-genetic evolution. In this paper I examine how new discoveries in neuroscience, quantum biology, and quantum physics have shown that a form of non-local connected consciousness has a physical-scientific foundation.

Steps Towards An Evolutionary Physics

Steps Towards an Evolutionary Physics x As did Prigogine, Enzo Tiezzi is using entropy as the core thermodynamic variable. Entropy can be used to describe systems far from thermodynamic equilibrium, provided that it is applied as a non-state function. Free energy and entropy are not state functions when applied on living organisms or ecosystems.

The entire optimization process is explained below in four major steps and coded in R for one iteration (or generation). Step — 1. This step starts with guessing of initial sets of a and b values which may or may not include the optimal values. These sets of values are called as 'chromosomes' and the step is called 'initialize ...

Here we outline four areas in evolutionary biology where analogies with models from theoretical physics appear natural and might be constructive: (i) correspondence between quantities that characterize genome evolution and those that are used to describe the evolution of simple physical systems in phenomenological thermodynamics, (ii) competing interactions and frustrated states, analogous to ...

Endosymbiotic theory suggests that mitochondria evolved from free-living prokaryotes which entered the host cell and were retained as endosymbionts. Here, we model this earliest stage of the endosymbiotic theory of mitochondrial evolution by engineering endosymbiosis between two genetically tractable model organisms, *Escherichia coli* and *Saccharomyces cerevisiae* .

In evolutionary biology, abiogenesis, or informally the origin of life (OoL), is the natural process by which life has arisen from non-living matter, such as simple organic compounds. While the details of this process are still unknown, the prevailing scientific hypothesis is that the transition from non-living to living entities was not a single event, but an evolutionary process of ...
