Fig. 1 shows a time-coordinated system of ground-fault relays in a low-voltage distribution arrangement. Its relay scheme operates as follows: GFP-1 responds after a time delay of 12 cycles to any ground fault that hasn't been cleared by GFP-2 or GFP-3. GFP-2 responds after a delay of 6 cycles to any fault that hasn't been cleared by GFP-3.

System grounding works by sending any built up static discharge to the ground through a heavy grounding electrode conductor and then into an earthing electrode. System Grounding is not to be confused with Equipment Grounding. Equipment grounding is a component of electrical systems that protects against fault currents.

### **An Overview Of Grounding System (Ungrounded)**

If a second ground fault occurs, a ground fault protection relay must trip the breaker to protect the circuit. On an HRG system, a sensing resistor is used to continuously monitor system continuity. If an open-circuit is detected (e.g., due to a broken weld on the NGR), the monitoring device will sense voltage through the sensing resistor and trip the breaker.

## **Ground Fault Protection for an Ungrounded System**

Although ungrounded systems do not cause significant damage during the first ground fault, the numerous disadvantages associated with ground faults resulted in a change to the grounding philosophy. There are other advantages for a grounded system, such as reduction of shock hazards and protection against lightning.

## **System Grounding Ground Fault Protection**

A single phase to ground fault on a field is dangerous because a second ground fault could short part of the field winding, causing damaging vibrations. A field ground fault must be detected and removed quickly and efficiently. The following is a circuit that could be used for field ground generator protection.

neutral is still coupled to ground via system capacitance [3]. For a ground fault on an ungrounded system, the fault currents remain close to zero as the faulted phase voltage approaches the same potential as ground. The unfaulted phase voltages increase with respect to ground and resulting in an overvoltage condition.
