The two main types of dialysis, hemodialysis and peritoneal dialysis, remove wastes and excess water from the blood in different ways. Hemodialysis removes wastes and water by circulating blood outside the body through an external filter, called a dialyzer, that contains a semipermeable membrane. The blood flows in one direction and the dialysate flows in the opposite.

Most systems are "function-focused," designed to get the job done quickly. This is like a factory that assumes its workers will do their jobs because they are required to. However, Human-Focused Design remembers that people in a system have feelings, insecurities, and reasons why they want or do not want to do certain things, and therefore ...
