toolkit

The Alpha engine is conceptually the simplest Stirling engine configuration, however suffers from the disadvantage that both the hot and cold pistons need to have seals to contain the working gas. There are a number of mechanical mechanisms which enable this type of engine to operate correctly with the correct phasing of the two pistons.

Configurations - updated  
3/30/2013

The aim of this project was to design, build, and test a Stirling engine capable of generating between 200-500 watts of electricity.

Several designs were studied before settling on an alpha type configuration based around a two-cylinder air compressor. Concentrated solar

## Stirling Engine - Real World Physics Problems

The Alpha engine is a two cylinder engine with two different pistons. This engine design has been used in a lot of experiments including Solar Power experiments for "green" energy. It has a higher efficiency than the other two types of engines so it is typically used more often. The Beta engine has a one cylinder two piston setup.

engine. The working gas inside the engine is repeatedly "shuttled" back and forth between the expansion and compression space, due to the up-and-down motion of the two pistons. This repeatedly forces the working gas back and forth through the heater, regenerator and cooler. As a result, the gas is repeatedly heated and cooled, and power is produced. Alpha engines are the simplest to understand, and are the easiest to construct.
