UML 2.0 - Overview - Tutorialspoint

The Unified Modeling Language (UML) is a general-purpose, developmental, modeling language in the field of software engineering, that is intended to provide a standard way to visualize the design of a system. The creation of UML was originally motivated by the desire to standardize the disparate notational systems and approaches to software design.

UML 2.2 Diagrams Overview. UML diagram contains graphical elements (symbols) - UML nodes connected with edges (also known as paths or flows) - that represent elements in the UML model of the designed system. The UML model of the system might also contain other documentation such as use cases written as templated texts.

UML 2.0 Superstructure defines the user constructs of UML 2.0. It means those elements of UML that the users will use at the immediate level. This is the main focus for the user community of UML. This revision of UML was created to fulfil a goal to restructure and refine UML so that usability, implementation, and adaptation are simplified.

Unified Modeling Language - Wikipedia

In the Unified Modeling Language (UML), an Element is an abstract class with no superclass. It is used as the superclass or base class, as known by object oriented programmers, for all the metaclasses in the UML infrastructure library. All other elements in the UML inherit, directly or indirectly from Element.
