Probability is a numerical description of how likely an event is to occur or how likely it is that a proposition is true. Probability is a number between 0 and 1, where, roughly speaking, 0 indicates impossibility and 1 indicates certainty. The higher the probability of an event, the more likely it is that the event will occur.

The exact probability test devised by Fisher, Irwin, and Yates (1) provides a way out of the difficulty. Tables based on it have been published - for example by Geigy (2) - showing levels at which the null hypothesis can be rejected. The method will be described here because, with the aid of a calculator, the exact probability is easily computed.

In probability theory, the birthday problem or birthday paradox concerns the probability that, in a set of n randomly chosen people, some pair of them will have the same birthday. By the pigeonhole principle, the probability reaches 100% when the number of people reaches 367 (since there are only 366 possible birthdays, including February 29). However, 99.9% probability is reached with just 70 ...
