Brain death is now defined as a complete and irreversible lack of measurable brain activity, as evidenced by two flatline EEG recordings taken 24 hours apart or lack of blood circulation to the brain. In brain death, the patient shows no responses to external stimuli, including pain, and no reflexes related to the cranial nerves.**

**Mind-wandering - Wikipedia
Then when participants became aware of this mind-wandering, brain regions related to the detection of salient or relevant events came online. After that, areas of the executive brain network took over, re-directing and maintaining attention on the chosen object. And all of this occurred within 12 seconds around those button presses.**
