Clifford algebra (geometric algebra) offers a natural and intuitive way to model geometry in fields as robotics, machine vision and computer graphics. This paper proposes a new representation based on fixed-size elements (quadruples) of 4D Clifford algebra and demonstrates that this choice leads to an algorithmic simplification which in turn leads to a simpler and more compact hardware ...

analysis without notation changes. Most applications of GA have been in theoretical physics, but GA is also a very good analysis tool for engineering. As an example, we use GA to study pattern rotation in optical systems with multiple mirror reflections.

Introduction and basic properties. A Clifford algebra is a unital associative algebra that contains and is generated by a vector space  $V$  over a field  $K$ , where  $V$  is equipped with a quadratic form  $Q : V \rightarrow K$ . The Clifford algebra  $Cl(V, Q)$  is the "freest" algebra generated by  $V$  subject to the condition  $v^2 = Q(v)1$ , where the product on the left is that of the algebra, and the  $1$  is its multiplicative identity.
