(c) There is no real solution given the constraints, we must specify more about the expansion (or compression) of A or B. For example, if A expands adiabatically, $P A = P B = 6.68 \text{ bar}$, $T A = 263.6 \text{ K}$, $T B = 881.3 \text{ K}$, $L A = 0.3917 \text{ m}$, and $L B = 0.0655 \text{ m}$. 3.7 Many variations are possible.

As the title suggests, we introduce a novel differential approach to solution thermodynamics and use it for the study of aqueous solutions. We evaluate the quantities of higher order derivative than the normal thermodynamic functions. We allow these higher derivative data speak for themselves without resorting to any model system.
