it to emit one less ton of CO₂ now, but otherwise leave climate change policy the same as the base case. This will produce a series of altered outcomes, including an altered time series of uncertain future consumption levels. The benefit payoff in any period is the change in consumption between the tweaked and baseline scenarios for that period.

Now it's time to ruthlessly prune and prioritize your ideas, so that you can focus time and money on the most significant ones. Refine each point to make your comparisons clearer. For example, only accept precise, verifiable statements such as, "Cost advantage of \$10/ton in sourcing raw material x," rather than, "Better value for money."

Fits of nonlinear difference equations to time series with observation errors were examined by stochastic simulation and analysis of plankton time series from two lakes. Even modest observation errors (e.g., coefficient of variation among replicate samples $\approx 10\%$) cause errors in model identification and bias in parameter estimates. The latter problem can be corrected by estimation techniques ...
