Hydraulic shock (colloquial: water hammer; fluid hammer) is a pressure surge or wave caused when a fluid, usually a liquid but sometimes also a gas, in motion is forced to stop or change direction suddenly; a momentum change. This phenomenon commonly occurs when a valve closes suddenly at an end of a pipeline system, and a pressure wave propagates in the pipe.

In time series analysis, it is practical to measure the frequency in cycles per unit of time, which we denote by ν . If the unit of time is 1 year, the frequencies could be for example $\nu=8$, $\nu=4$, $\nu=1$ or maybe 2 cycles per year. Hence in this application the relevant argument in the trigonometric function is positive. In classical harmonic
