The Turing Test (Stanford Encyclopedia of Philosophy)

To avoid prejudicial rejection of evidence of machine intelligence, Turing suggested the "imitation game," now known as the Turing test: a remote human interrogator, within a fixed time frame, must distinguish between a computer and a human subject based on their replies to various questions posed by the interrogator. By means of a series of such tests, a computer's success at "thinking" can be measured by its probability of being misidentified as the human subject.

Essentially, Hutchens is making the case that the Turing Test is a poor test of intelligence, that it encourages trickery, not intelligent behaviour, and that many intelligent systems would fail this test. The Loebner Prize is the first formal instantiation of a Turing Test.
