Vif  
In statistics, the variance inflation factor (VIF) is the quotient of the variance in a model with multiple terms by the variance of a model with one term alone. It quantifies the severity of multicollinearity in an ordinary least squares regression analysis. It provides an index that measures how much the variance (the square of the estimate's standard deviation) of an estimated regression ...

Multicollinearity | Detecting Multicollinearity with VIF  
The most common way to detect multicollinearity is by using the variance inflation factor (VIF), which measures the correlation and strength of correlation between the predictor variables in a regression model. The value for VIF starts at 1 and has no upper limit. A general rule of thumb for interpreting VIFs is as follows:

Variance Inflation Factor (VIF) - Overview, Formula, Uses  
Viral infectivity factor, or Vif, is an accessory protein found in HIV and other lentiviruses.Its role is to disrupt the antiviral activity of the human enzyme APOBEC (specifically APOBEC3G, "A3G" in short) by targeting it for ubiquitination and cellular degradation. APOBEC is a cytidine deaminase enzyme that mutates viral nucleic acids.. Vif is a 23-kilodalton protein that is essential for ...

Variance Inflation Factor Definition - Investopedia  
The VIF can be applied to any type of predictive model (e.g., CART, or deep learning). A generalized version of the VIF, called the GVIF, exists for testing sets of predictor variables and generalized linear models. How to interpret the VIF. A VIF can be computed for each predictor in a predictive model.
