Some modern Volvo Penta Marine Engines have fuel injectors and these should also be checked, preferably by an engineer. The older models have carburetors and although these give little trouble, the main jets, O-rings, and gaskets can become worn allowing excessive fuel to enter the engine. The carburetor is easily stripped and worn parts replaced.

One possible contaminant is air. If air enters the injector pipes, the engine will stop because the air will act as a shock absorber, preventing the fuel pressure from rising high or quickly enough to be sprayed into the cylinder. This is a common problem that is easily solved by bleeding the fuel system of air.

This causes stalling of the engine. If you back off the throttle the fuel demand decreases allowing the sludge to fall off the tube. Now what you can do to verify this as an issue is run the engine on another fuel source. If the engine runs good then you know the fuel tank is dirty causing your issue.
